Best Practices for Managing Data in Your Research

Isaac Pratt, PhD + Danica Evering, MA
Research Data Management Specialists
rdm@mcmaster.ca

Research Data Management Workshop Series
September 27, 2023

McMaster University is located on the traditional territories of the Mississauga and Haudenosaunee Nations, and within the lands protected by the “Dish With One Spoon” wampum agreement.

Georgia Kirkos, “Cootes Trail,” October 29, 2021, McMaster University, Hamilton, Ontario, Canada

<https://brand-resources.mcmaster.ca/asset-bank/action/viewAsset?id=40841&index=14&total=34&view=viewSearchItem>

Code of Conduct

The Sherman Centre and the McMaster University Library are committed to fostering a supportive and inclusive environment for its presenters and participants.

As a participant in this session, you agree to support and help cultivate an experience that is collaborative, respectful, and inclusive, as well as free of harassment, discrimination, and oppression. We reserve the right to remove participants who exhibit harassing, malicious, or persistently disruptive behaviour.

Please refer to our code of conduct webpage for more information:
scds.ca/events/code-of-conduct/

Session Recording and Privacy

This session is being recorded with the intention of being shared publicly via the web for future audiences. In respect of your privacy, participant lists will not be shared outside of this session, nor will question or chat transcripts.

Questions asked via the chat box will be read by the facilitator without identifying you. Note that you may be identifiable when asking a question during the session in an audio or visual format.

Certificate Program

The Sherman Centre offers a Certificate of Attendance that rewards synchronous participation at 7 workshops. We also offer concentrations in Data Analysis and Visualization, Digital Scholarship, and Research Data Management.

Learn more about the Certificate Program: <https://scds.ca/certificate-program>

Verify your participation at a session: <https://u.mcmaster.ca/verification>

At an unspecified point during the workshop, a code will be read aloud. This is the answer to the third question of the form.

Research Data Management Workshops

Register for upcoming RDM events: <https://rdm.mcmaster.ca/events>

- Sept. 28:** “RDM Community of Practice - Data Management Plan Roundtable”
- Oct. 25:** “Data Management Plans and Intro to DMP Assistant”
- Nov. 29:** “Depositing & Sharing Data Online with McMaster Dataverse”
- Feb. 14:** “Storage Scores: Store & Back Up Data at McMaster”
- Mar. 20:** “How to Implement Encryption to Protect Your Research Data”
- Apr. 17:** “Sensitive Data Management”
- May 14:** “Data Management Plan (DMP) Bootcamp”
- Jun. 18:** “Data Deposit Bootcamp”

Hello! A bit about us:

We are Research Data Management Specialists

Isaac Pratt, PhD

My background is in **Biological Anthropology, Medical Imaging, and Human Anatomy.**

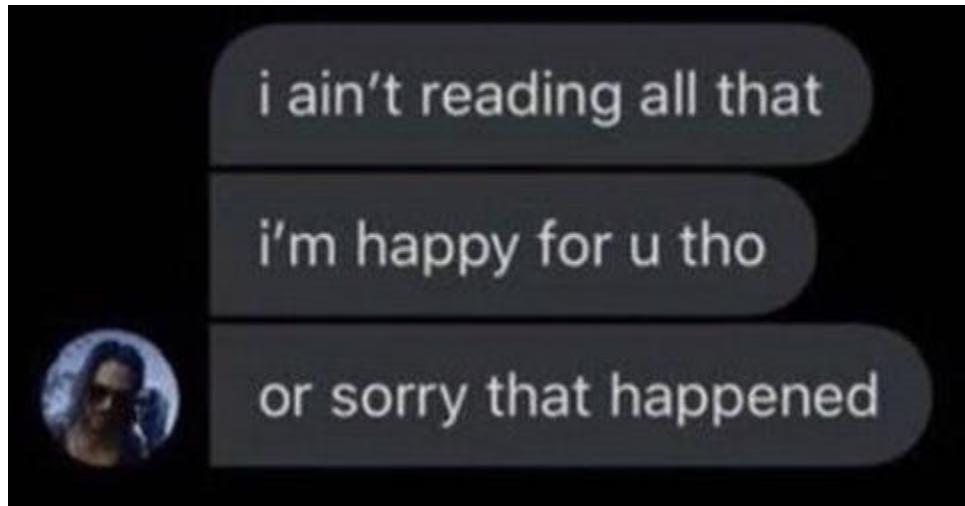

I have a PhD in **Anatomy & Cell Biology** from the University of Saskatchewan.

Danica Evering, MA

My background is in **social practice art, community-based research, communications studies, and medical laboratory healthcare.**

I have an MA in **Media Studies** from Concordia University.

Outline

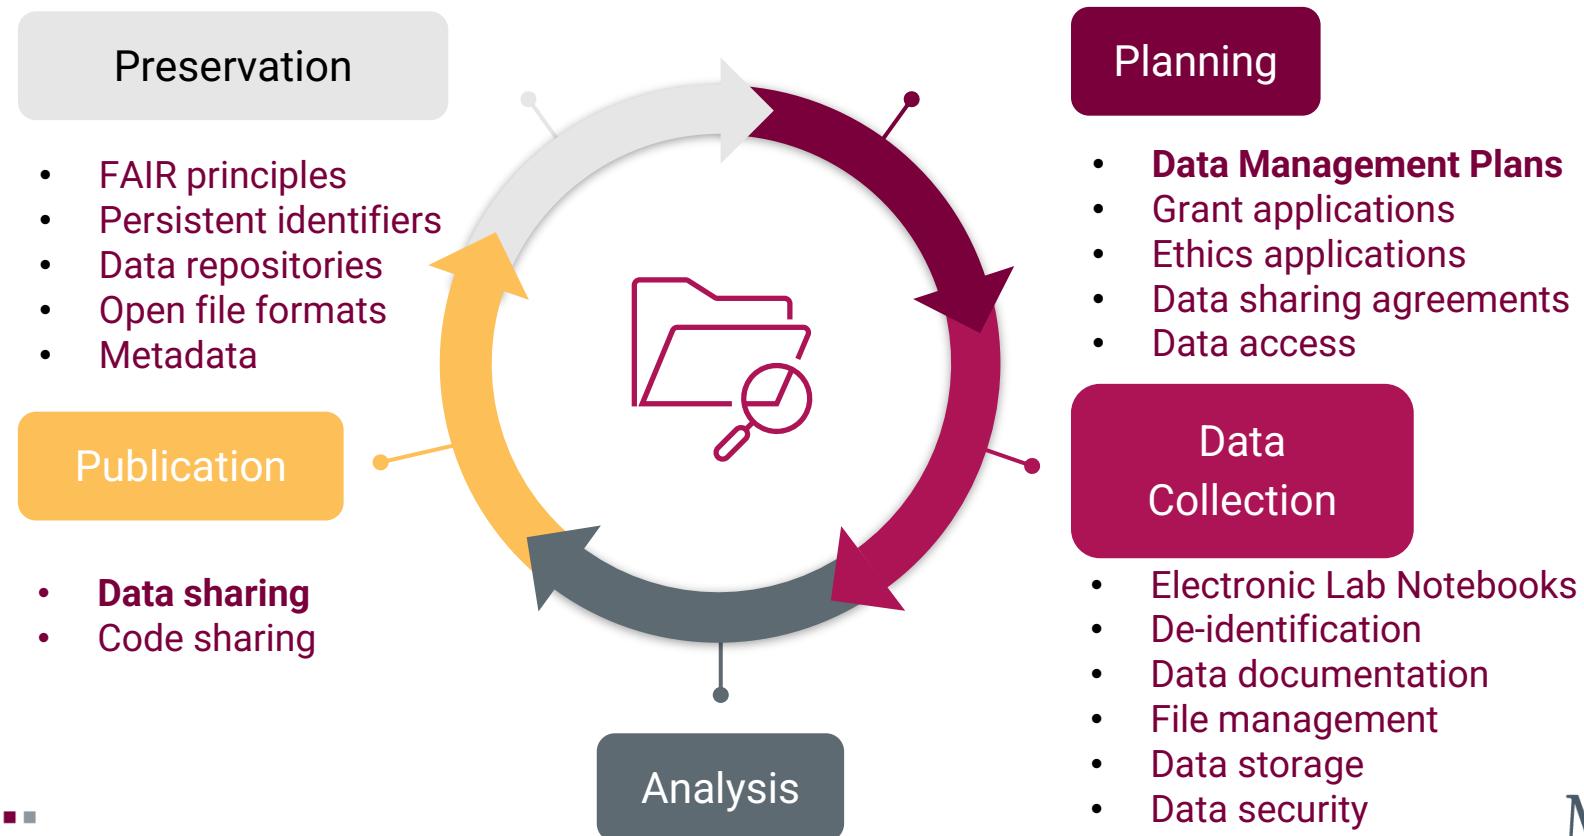

TL;DR – Best Good Enough Practices for Managing Data in Your Research

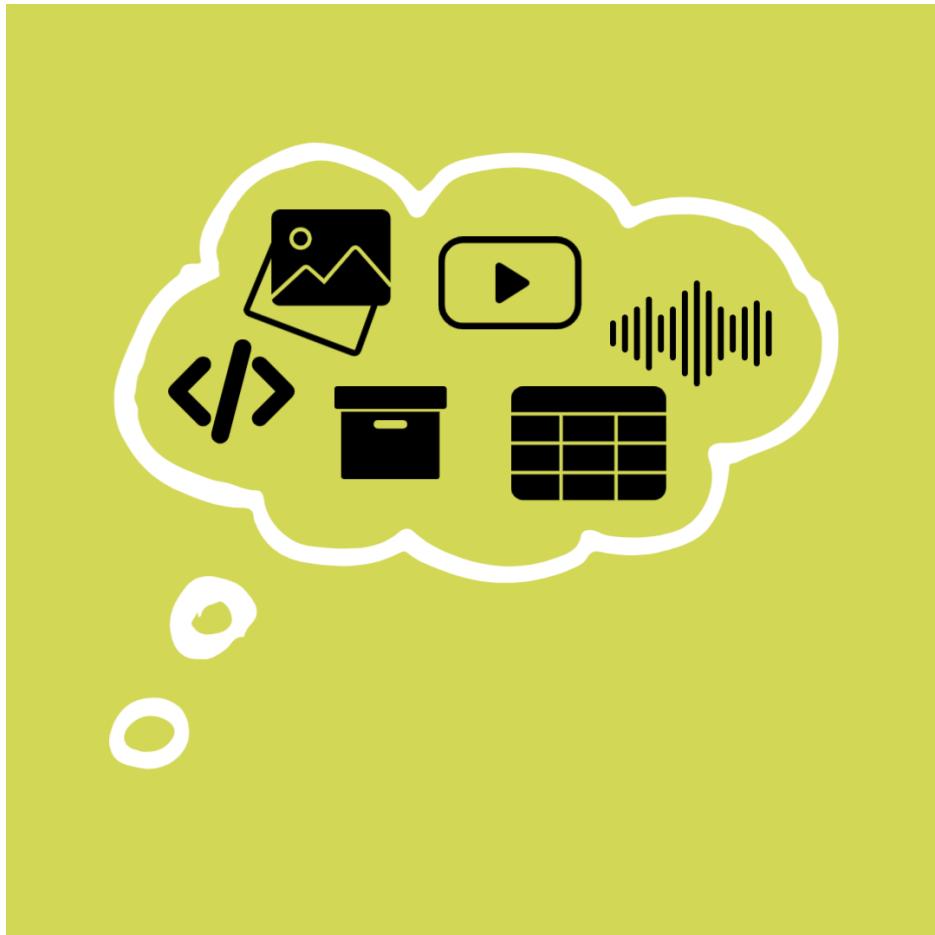

- Everyone has data even (if you don't think you do!)
- Don't be like Dave
- 1. Make a plan for your data
- 2. Organize and document your data consistently
- 3. Store and back up your data securely
- 4. Make sure your data is ready for **archival and sharing**

What is Research Data Management?

Research Data Management is a suite of connected processes and practices applied throughout the research lifecycle, as data are **planned** for, **collected**, **organized**, **documented**, **stored**, **preserved**, **shared**, and **reused**, in support of analysis, research, creative works, and dissemination that benefit society.

Do I even have research data to manage? (You do!)

“Data may be in any format or medium taking the form of text, numbers, symbols, images, films, video, sound recordings, pictorial reproductions, drawings, designs or other graphical representations, procedural manuals, forms, diagrams, workflows, equipment descriptions, data files, data processing algorithms, software, programming languages, code, or statistical records.”

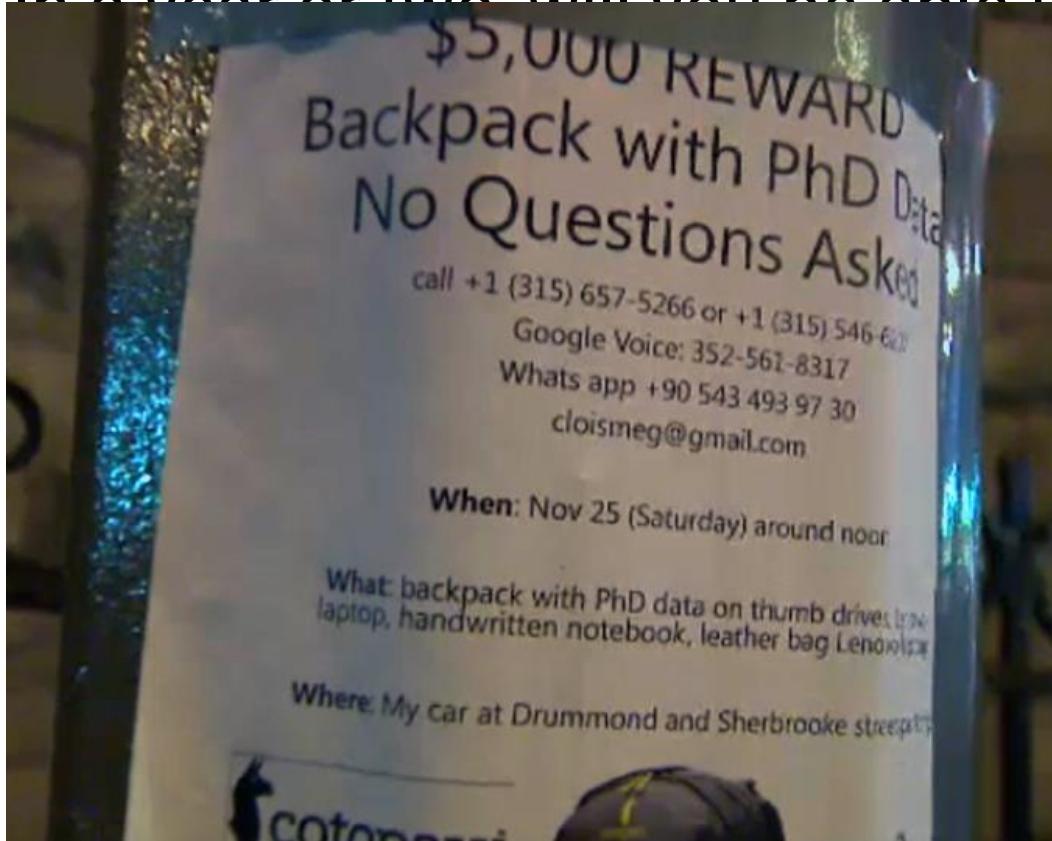

Innovation, Science and Economic Development Canada. “Frequently Asked Questions -Tri-Agency Research Data Management Policy.” Government of Canada. Innovation, Science and Economic Development Canada, October 19, 2021.
https://science.gc.ca/eic/site/063.nsf/eng/h_97609.html#1a

Is your data vulnerable?

- In a year or two, will you be able to remember all the details of your experiments? Have you recorded all the little details?
- What will happen to your data when you graduate/move/retire?
- How much work would you have to do if you lost your data?
- If you needed to share your data with a collaborator, would they be able to understand it without your help?

Is your data vulnerable?

- In a year or two, will you be able to remember all the details of your

FOR MY LOST LAPTOP

I am a Rutgers Chemistry 5th year PhD student. On April 19th afternoon, my LENOVO THINKPAD T420S laptop was stolen from room 203 of Wright-Rieman building. If you stole my laptop and now you are reading this letter, I would like to say that you can keep the computer and I would like to pay you money for my data under D drive. The data is my FIVE-YEAR work. I really need the data under the D drive, there is a folder named RESEARCH, under RESEARCH folder, there is a THESIS folder. I only need that folder for my thesis defense, which is coming very soon. I would like to pay you \$1000 and use whatever way you offer to send you the money. The price is negotiable. My laptop password is 850713zd, my email address is [REDACTED] and phone number is [REDACTED]. PLEASE contact me and I would appreciate it so much!!!

Is your data vulnerable?

- In a year, the National Museum of Brazil experienced a massive fire. What were they doing? How much data did they have? If you had a fire, would you be able to recover it?

Is your data vulnerable?

University of Manitoba Psychology

- In a year or two, who will be responsible for your experiments? Have you thought about the details of your legacy?
- What will happen to your data when you retire/move/retire?
- How much work would it take to migrate your data?
- If you needed to share your data with another researcher, would they be able to understand it?

Winnipeg Free Press

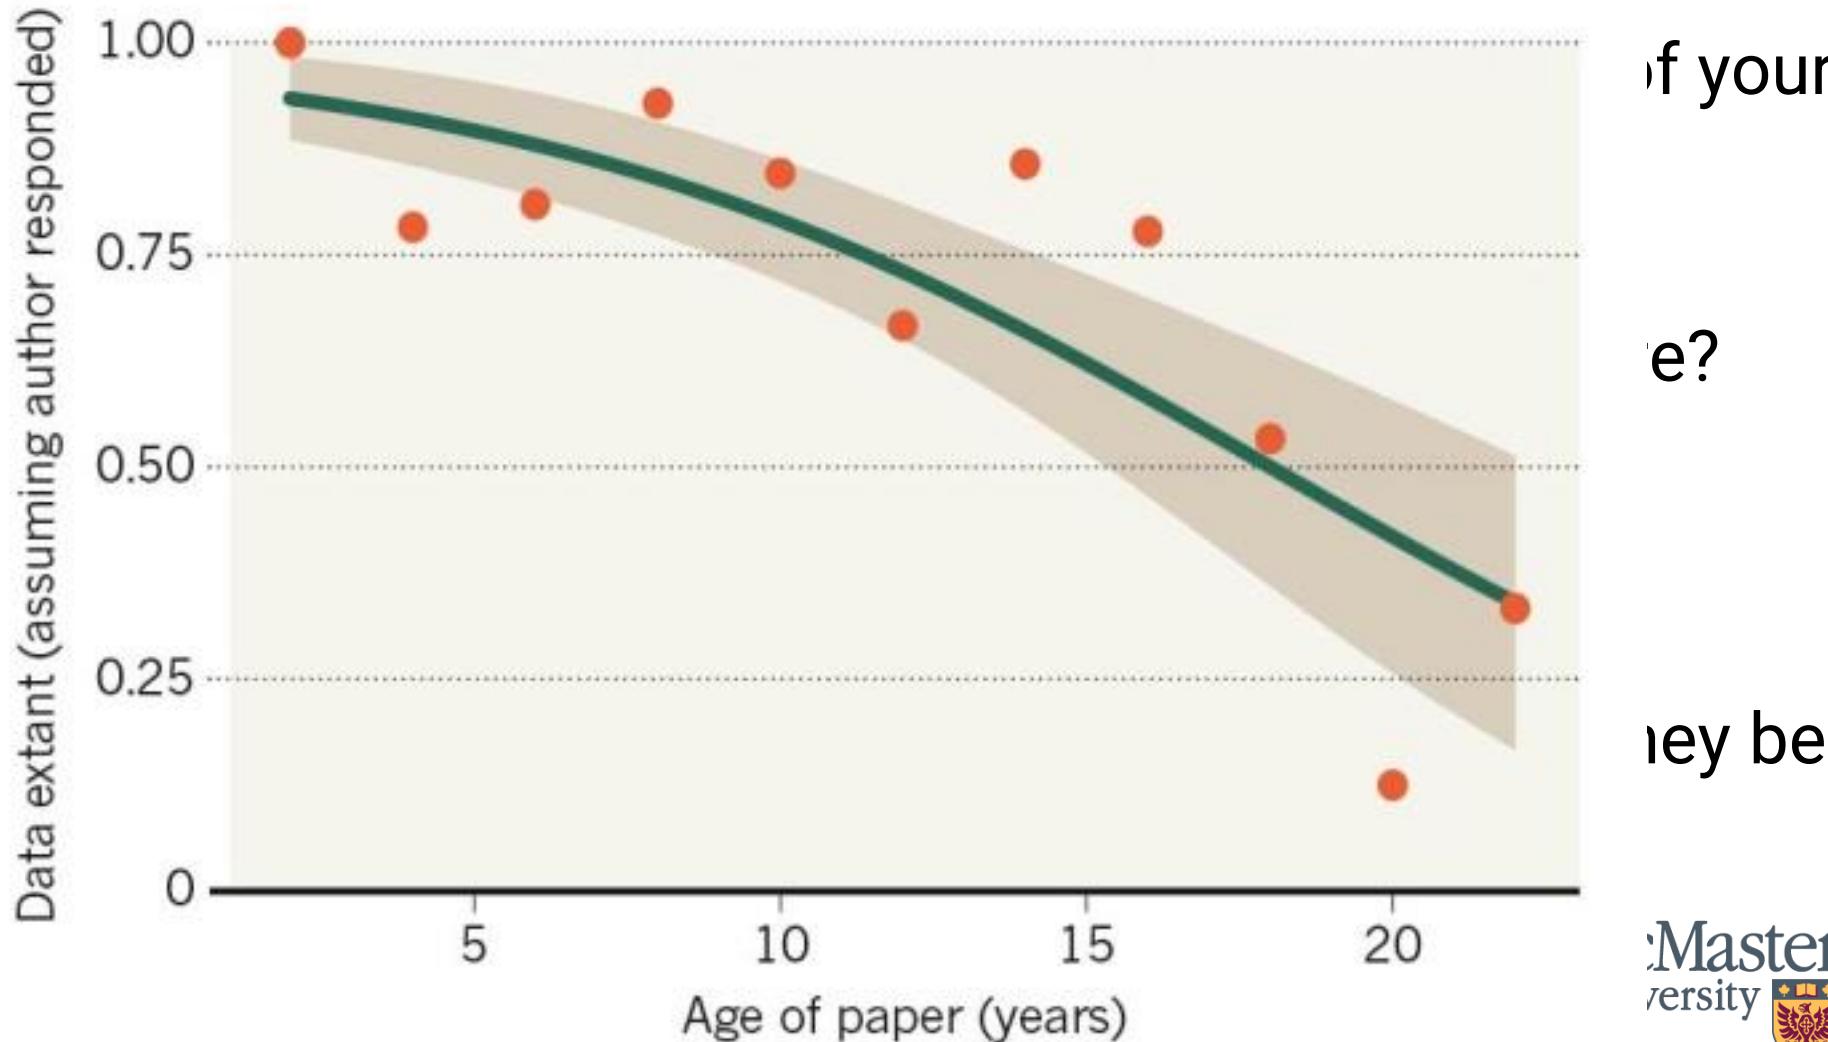

Is your data

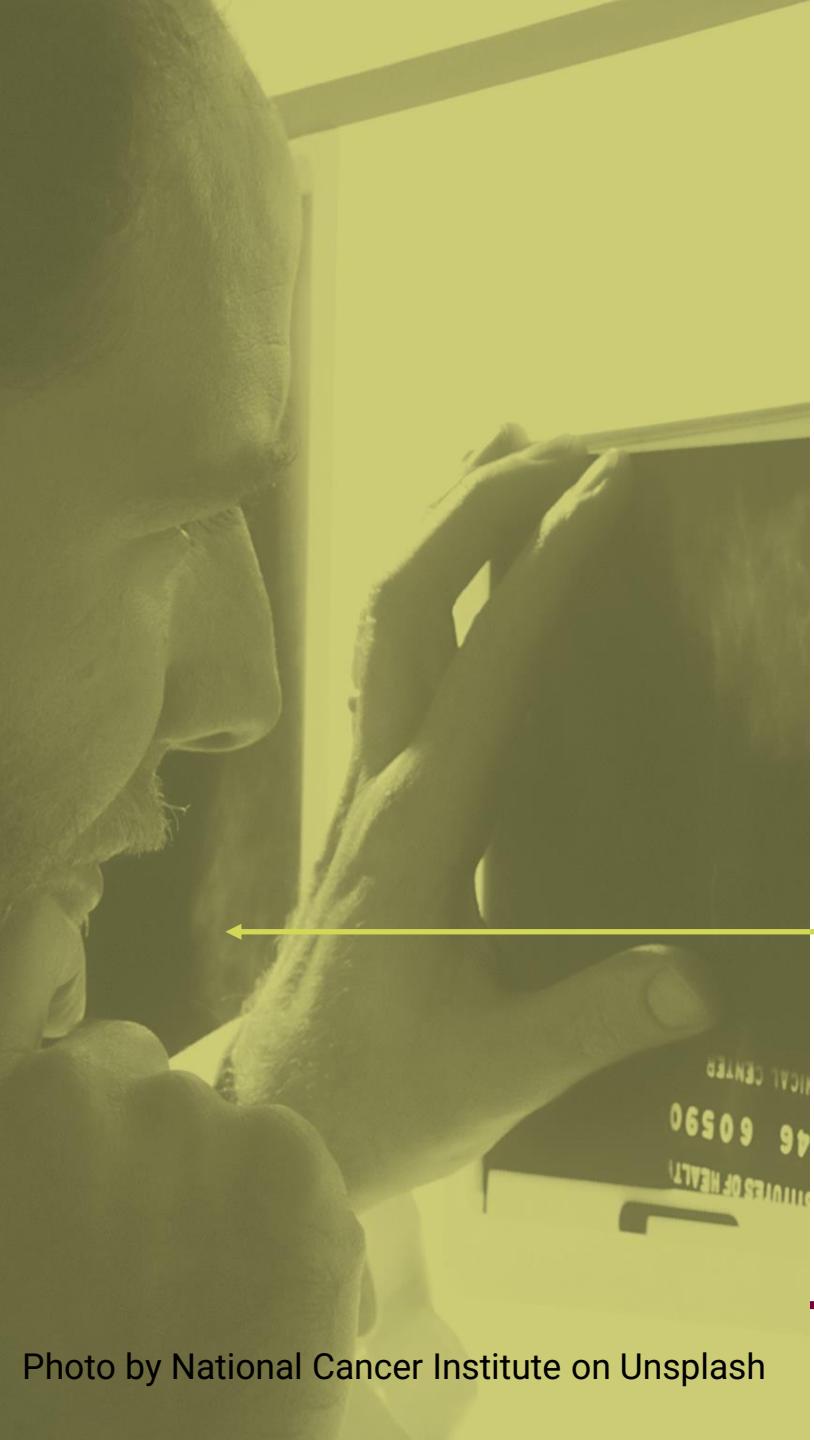

MISSING DATA

Vines et al 2014

As research articles age, the odds of their raw data being extant drop dramatically.

- In a year experin
- What w
- How m
- If you n
able to

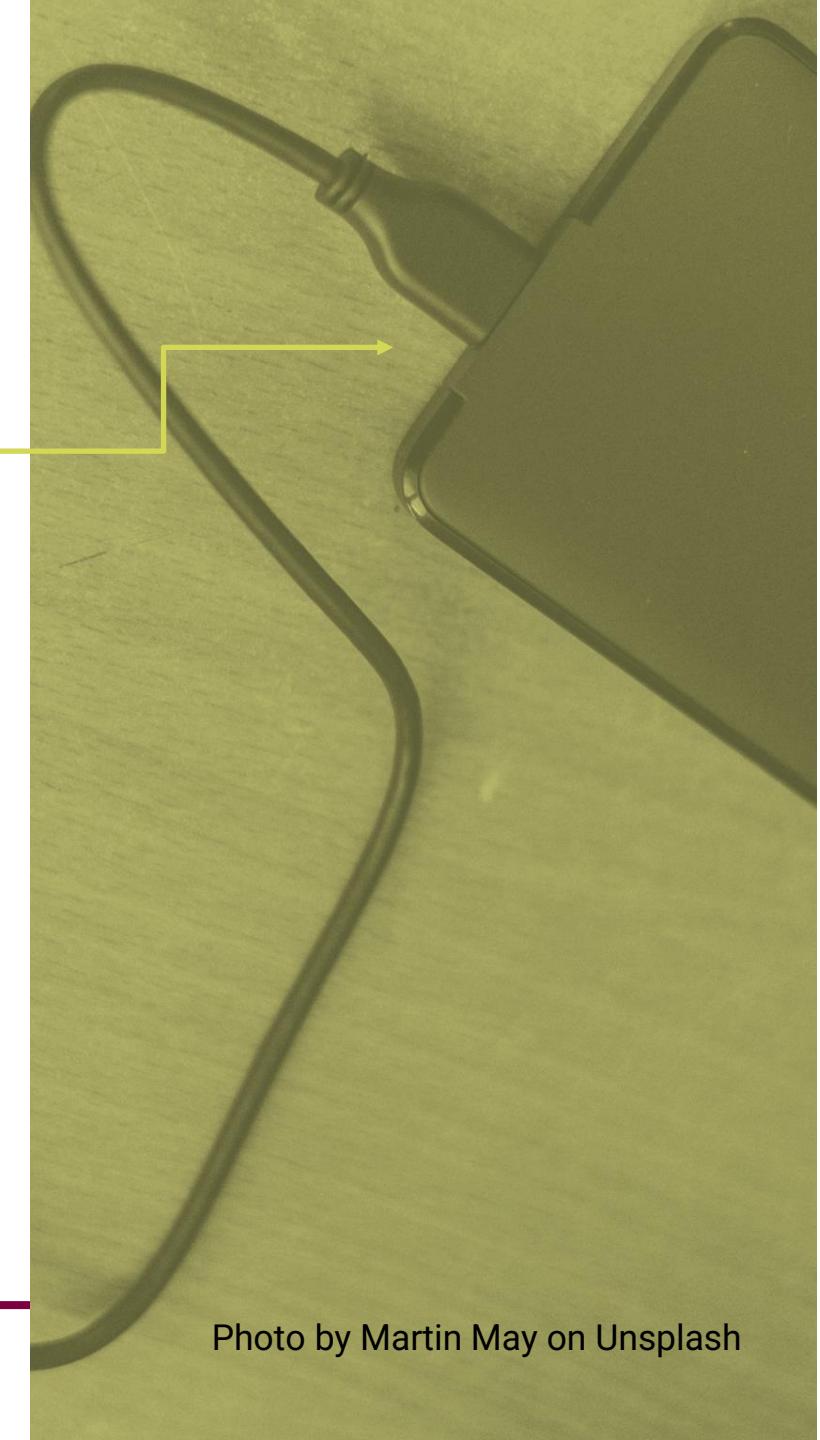

Let's look at an example:

“Dave” is a graduate student working in Biomedical Science, focused on x-ray imaging of bone tissue samples. Dave’s data is made up of 3 major components:

- **Image files** – x-ray scan images, microscope images.
- **Software/hardware configuration files** – instrument specific files, scripts, text files
- **Measurement data files** – spreadsheet files

Example practices:

- Dave's data is stored separately in a few places:
 - Image files are large (2+ TB) and stored on lab computers and a collection of **miscellaneous external hard drives** accumulated over the years.
 - The other files are smaller (10 GB) and stored on a personal laptop and a cloud storage platform (OwnCloud).
- Data is not consistently documented
- Data is not published or shared outside the research group except by direct request. No time or energy is put into archiving the research data.

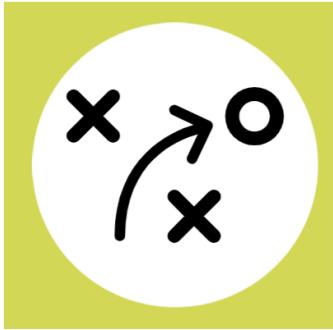

What went wrong for Dave

- One of the external drives fails, leading to the loss of some of Dave's data prior to analysis being completed. This data loss is not discovered for several weeks. **There is no back up of this data.**
- This leaves Dave with two choices:
 - Recollect that data which may take a significant amount of time, or
 - Publish what he can, even though the power of the study has been reduced

What could you do to be better?

Make a plan for your data	Prepare yourself for future challenges and problems
Organize and document your data consistently	Save yourself time and resources in the future.
Store and back-up your data securely	Avoid loss of data from theft, corruption, or failure of storage devices.
Make sure your data is ready for archival and sharing	increase the accessibility of your research and allow others to reproduce and use your results.

1. Make a plan for your data

- A **Data Management Plan (DMP)** is your plan for how you will create, store, organize, document, secure, preserve, and share your research data.
- A document which speaks to the management of data both **during** the active phases of your research and **after** the completion of the research project.

Why create a DMP?

- A **living document** – something you'll work with, adapt, and change through your research.
- Create it at the start of your research - avoid pitfalls and problems before they occur.
- Prepare for future stages of research including potential data sharing (if desired).
- Research is a team effort – collaborate on your DMP.
- Many research funders require grant applicants to submit a DMP – including the Tri-Agencies (NSERC, CIHR, SSHRC – started 2022), NIH, and others.

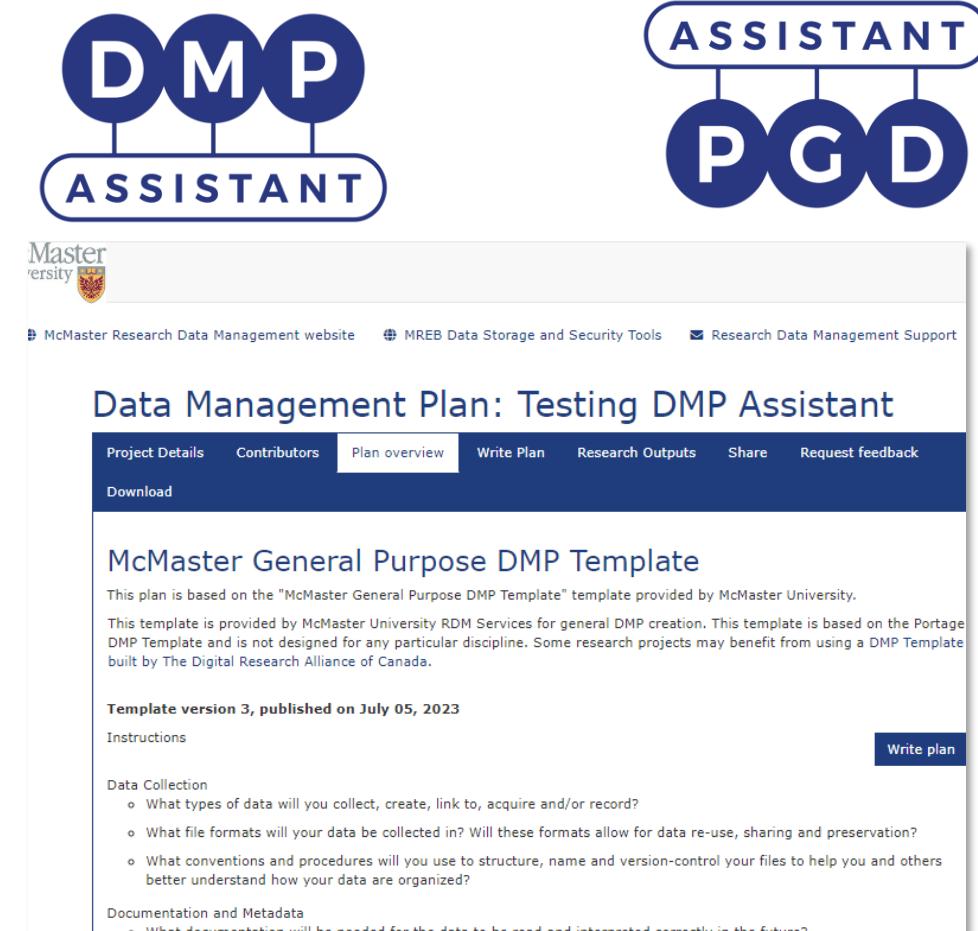

What goes in a Data Management Plan?

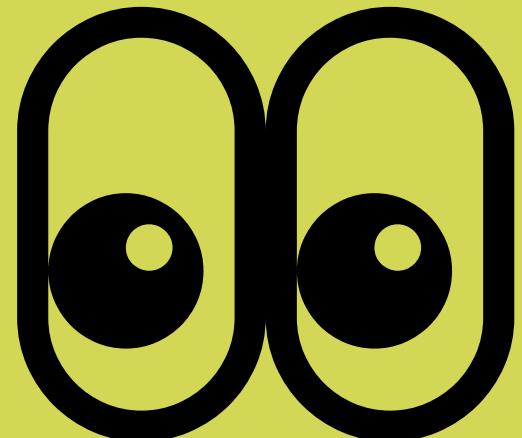

DMP Assistant

- A web-based, bilingual data management planning tool.
- Available to all researchers in Canada.
- Walks you through relevant questions for data management.
- Templates and exportable plans.
- Send to RDM Services for review!
- Access at rdm.mcmaster.ca/plan

The screenshot shows the McMaster Research Data Management website's interface for creating a Data Management Plan. At the top, there's a logo for "DMP ASSISTANT" featuring three circles with letters D, M, P above a bar with the word ASSISTANT. Below the logo is the McMaster University crest. The main navigation menu includes "Project Details", "Contributors", "Plan overview" (which is highlighted), "Write Plan", "Research Outputs", "Share", and "Request feedback". A "Download" button is also visible. The central content area is titled "Data Management Plan: Testing DMP Assistant" and is based on the "McMaster General Purpose DMP Template". It includes sections for "Instructions", "Data Collection" (with bullet points about types of data, formats, and conventions), and "Documentation and Metadata" (with a bullet point about documentation needs). At the bottom right of this section is a "Write plan" button.

Who do you think could potentially be involved in reviewing a DMP?

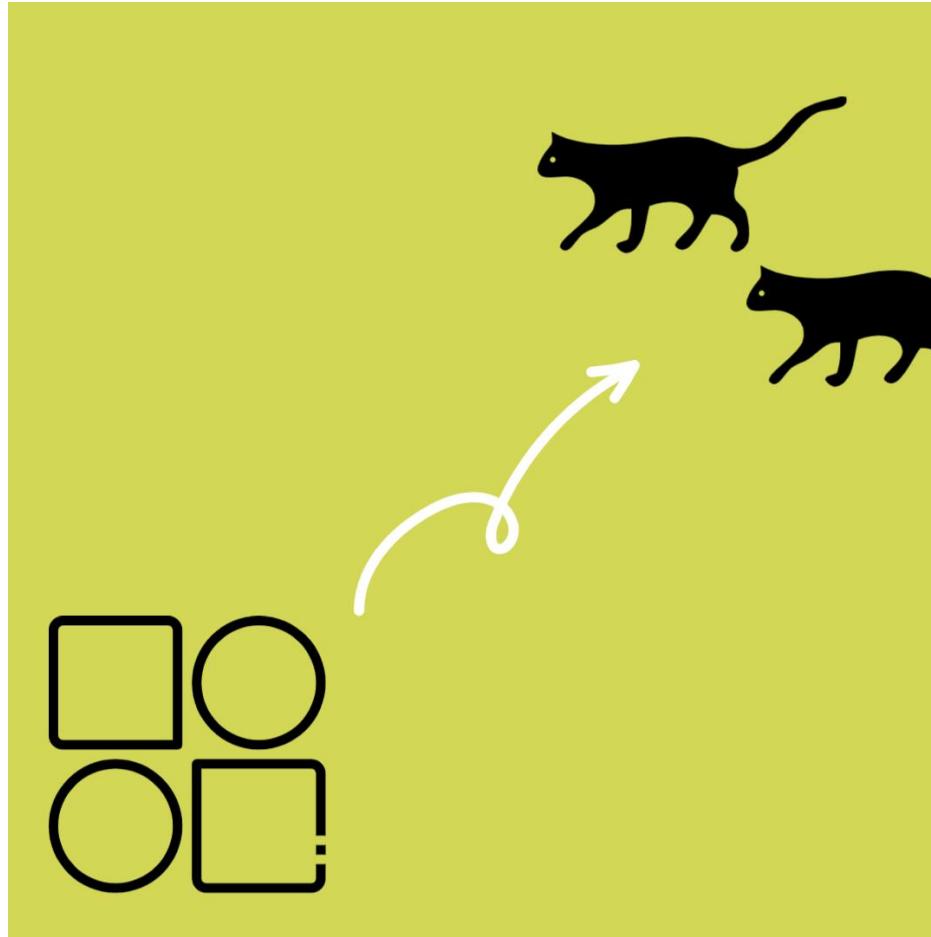

2. Organize and document your data consistently

- If you needed to use data you collected a year ago, how easy would they be to find and use?
- Would you know what every variable is?
- Would you have information about when/where/how the data was collected?
- Have you ever gone to analyze data or publish a paper only to find that some critical piece of information was not recorded, or you don't remember where you wrote it down?

What were you thinking?

What did you mean when you made this variable “cat2”? Did it mean cat? Category? Something else?).

Raw data can be complicated. Numbers in a spreadsheet can be hard to interpret, variable names might have abbreviations that make it hard for others to understand what it truly is.

Documentation and organization make data easier to understand and reuse.

Example from Samantha Ming, “Bad Variable Names to Avoid,” Medium, October 8 2018. <https://medium.com/@samanthaming/bad-variable-names-to-avoid-%EF%B8%8F-bbab6614f36>

Cassia Read, David H Duncan, Chiu Y C Ho, Matt D White, and Peter A Vesk, "Soil Radiometrics: Field and Remotely-Sensed Data Sets for Model Building and Validation," OSF, June 15, 2018, osf.io/uac6x.

Research Project Management

- **Collaboration:** Google Docs and Microsoft Office let your team work on documents together in real-time, avoiding multiple versions and copies sent by email.
- **Reference Management:** Zotero, Mendeley, or Endnote support collaboration through shared citation libraries.
- **Notetaking software:** Obsidian, Evernote, OneNote, Notion, or an Electronic Lab Notebook allow you to create organized, linked notes that you can use to document your research practices.
- **Open Science Framework (OSF):** This free open platform for research collaboration lets you manage files, data, code, and protocols in one central location.

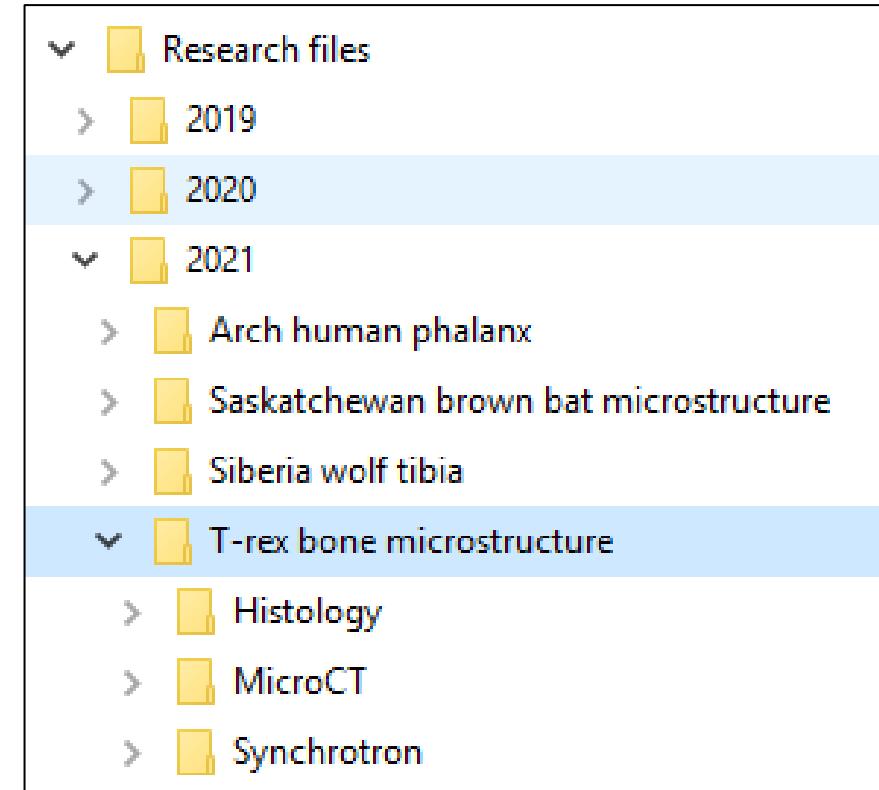

Learn more at rdm.mcmaster.ca/organize

Keeping folders organized makes it easier to find things.

Make organizing files and folders a habit – that way, it's easy to know where things go.

File organization schemes can include:

- By project
- By researcher
- By experiment type
- By date (often year)
- By some combination of the above
(i.e. a two level structure of year -> project)

Give your files good names!

Organizing your research files makes your data easier to understand, share, and archive—both now and in the future. A good file organization system should be **descriptive**, **standardized**, and **implemented consistently**.

- **File Naming:** Include date, project name, short description, initials of researcher, version number, and other metadata (like location).
 - e.g. `2023_02_08_YouthOutreach_GuelphStaff_TM.wav`
- **Update your team:** Once you've established a file organization and naming system, describe it in a README file for your research project and make sure everyone on your research team knows the system.

tip: if you start your file name with dates like 2023-10-03-filename they will sort by date automatically

Date: 2023_02_08 (collection date)
Project Name: YouthOutreach
Short Description: GuelphStaff
Name: TM (Tracy MacDern)

What issues can we see with these files? What did this person do well? What could they have done better?

A STORY TOLD IN FILE NAMES:

Copyright: Jorge Cham

www.phdcomics.com

Project: Kristin's important chemistry project

Date: June 2013-April 2014

Description: Description of my awesome project here

Funder: Department of Energy, grant no: XXXXXX

Contact: Kristin Briney, kristin@myemail.com

ORGANIZATION

All files live in the 'ImportantProject' folder, with content organized into subfolders as follows:

- 'RawData': All raw data goes into this folder, with subfolders organized by date*
- 'AnalyzedData': Data analysis files*
- 'PaperDrafts': Draft of paper, including text, figures, outlines, reference library, etc.*
- 'Documentation': Scanned copies of my written research notes and other research notes*
- 'Miscellaneous': Other information that relates to this project*

NAMING

Raw data files will be named as follows:

"YYYYMMDD_experiment_sample_ExpNum"
(ex: "20140224_UVVis_KMnO4_2.csv")

STORAGE

Documentation files

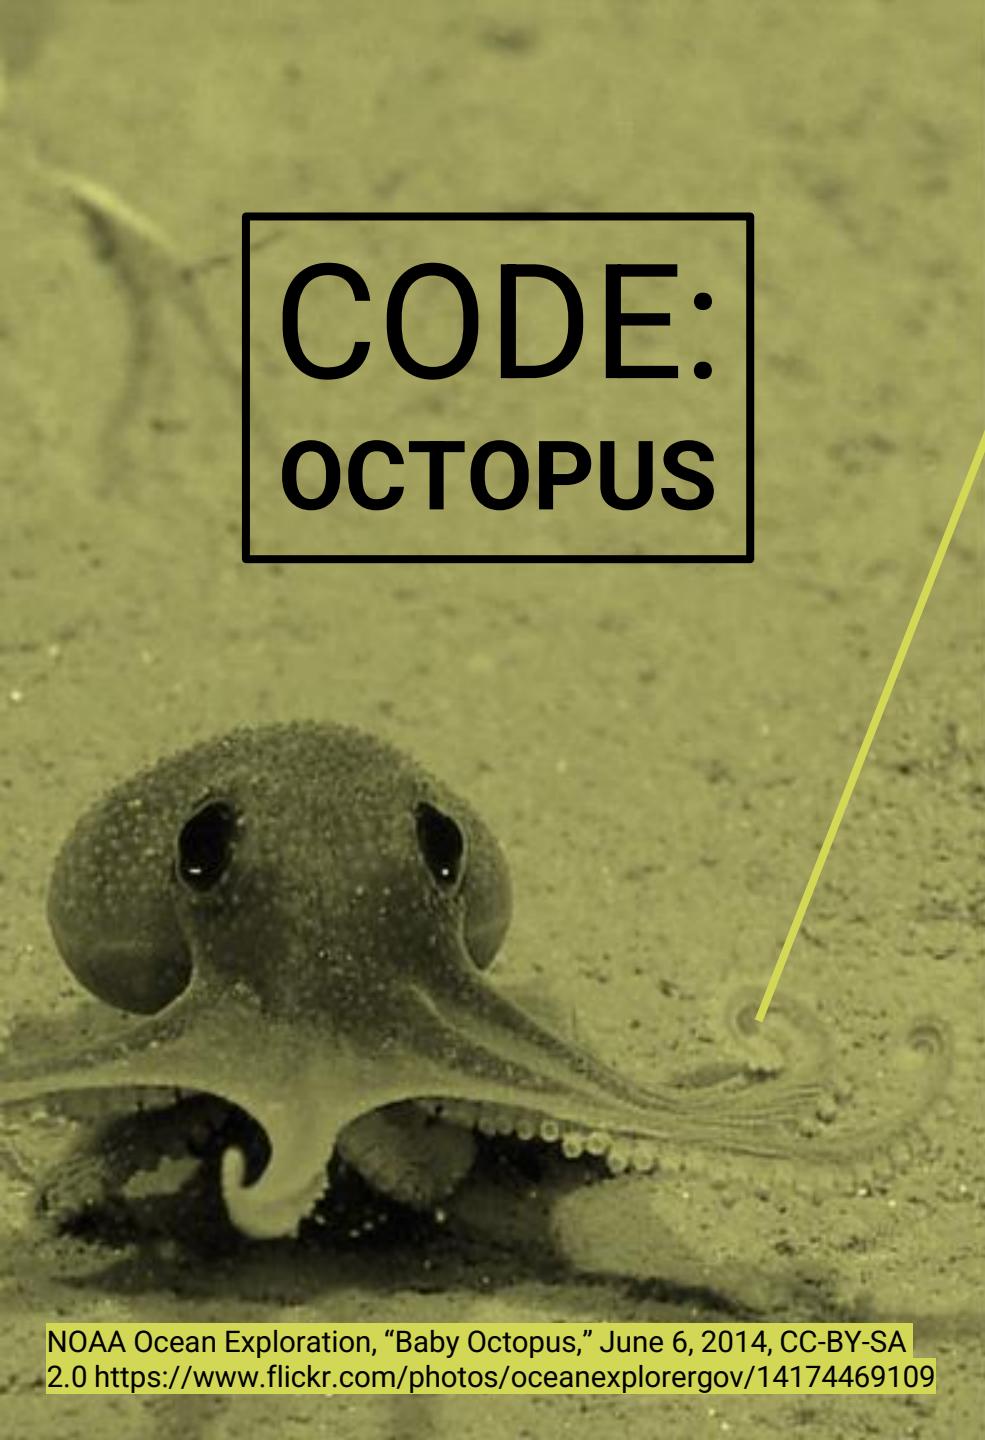

- **README:** A simple text document (.txt) that describes project information, folder hierarchy and file organization, description of important file contents.
- **Data Dictionaries:** A document for tabular data that describing names, labels, units, and constraints.
- **Codebooks:** Like data dictionaries but for survey or statistical data—includes the survey layout and structure, and codes for questions and answers.

Build a documentation scheme you will actually use!

The most important aspect of documentation is doing it.

Whatever file naming and organization scheme you choose, make sure it's **descriptive**, use it **consistently** and **document** it (in a readme.txt file).

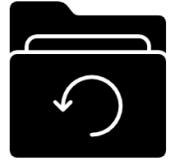

Take advantage of the software that is out there, including note-taking software, reference management software, and collaboration software.

**CODE:
OCTOPUS**

RDM Certificate Program

- Certificate you can add to your CV or ORCID
- Attend 7 RDM workshops to receive a certificate!
- Go to this website to verify today's session:
<https://u.mcmaster.ca/verification>
- Learn more about the Certificate Program:
<https://scds.ca/certificate-program>

4. Store and back-up your data securely

- **Data Loss**

- Theft of devices
- Loss of devices
- Accidental damage or destruction
- A USB drive is not an archive!

- **IT Security:**

- Computer viruses, malware, ransomware.

Even cautious people can lose data.

Dr. X leads a large, well-funded lab that conducts multiple expansive research projects. Because the lab is so busy, Dr. X and their team also receive many emails every day. Although they have taken some IT training, one of them clicks a link in a carefully-worded email and their research system becomes infected. All of Dr. X's critical research files are encrypted; locked down until the university pays a ransom. Depending on how well Dr. X's research is backed up, they could be facing an impossible decision: lose years of research...or pay up.

Avoiding Data Loss: 3-2-1 Backup Strategy

A good data storage plan needs to balance accessibility and convenience against security and reliability.

3

Copies of your data (at least!)

Example:

- 1 copy stored locally on **hard drive** for analysis
- 1 copy stored on **cloud storage** platform
- 1 copy stored in a **secure campus drive**

2

Copies are on-hand (easily accessible) on different systems (internal hard drive, cloud storage, etc.)

- a “**production**” (working) copy
- a “**production backup**” copy

1

Copy is in another location (“off-site”) from the others with a **trusted** service provider

Research Data Storage Finder Tool

<https://rdm.mcmaster.ca/finder>

- If you're looking for a good place to store research data, try our **Research Data Storage Finder** webtool, where you can get personalized recommendations.
- Answer questions to narrow down options depending on risk, volume, and other needs.
- This tool also allows you to compare feature sets of McMaster-approved options.
- Webinar on data storage:

<https://scds.github.io/intro-rdm/storage.html>

The screenshot shows the 'Data Storage Finder' tool interface. It consists of two main sections: 'Step 1' and 'Step 2'. Step 1 is titled 'Answer these questions to narrow down storage provider options' and contains two numbered questions: 'What risk level is your data?' and 'What type of data storage are you looking for?'. Each question has a 'Clear Answers' button. Step 2 is titled 'Select data storage providers you would like to compare' and displays a grid of 12 data storage provider cards. Each card includes the provider name, a brief description, and a circular selection button. The providers listed are: Compute Canada (Advanced research computing systems, storage and software), Compute Canada NextCloud (Advanced research computing File hosting services), Dataverse (Store, share, publish and discover research data), FRDR (Find and Share Research Data), Github (Distributed version control system for software code), MacDrive (File Synchronization and Sharing solution), MacDrive (Encrypted Data) (Encrypted File Synchronization and Sharing solution), and MacDrop (Web service transfer file).

Encrypt sensitive data:

Sensitive data is any data that would cause harm if released openly. This includes personally identifiable information and personal health information.

Encryption is a process of transforming information so that it is only readable to a person with the correct authorization.

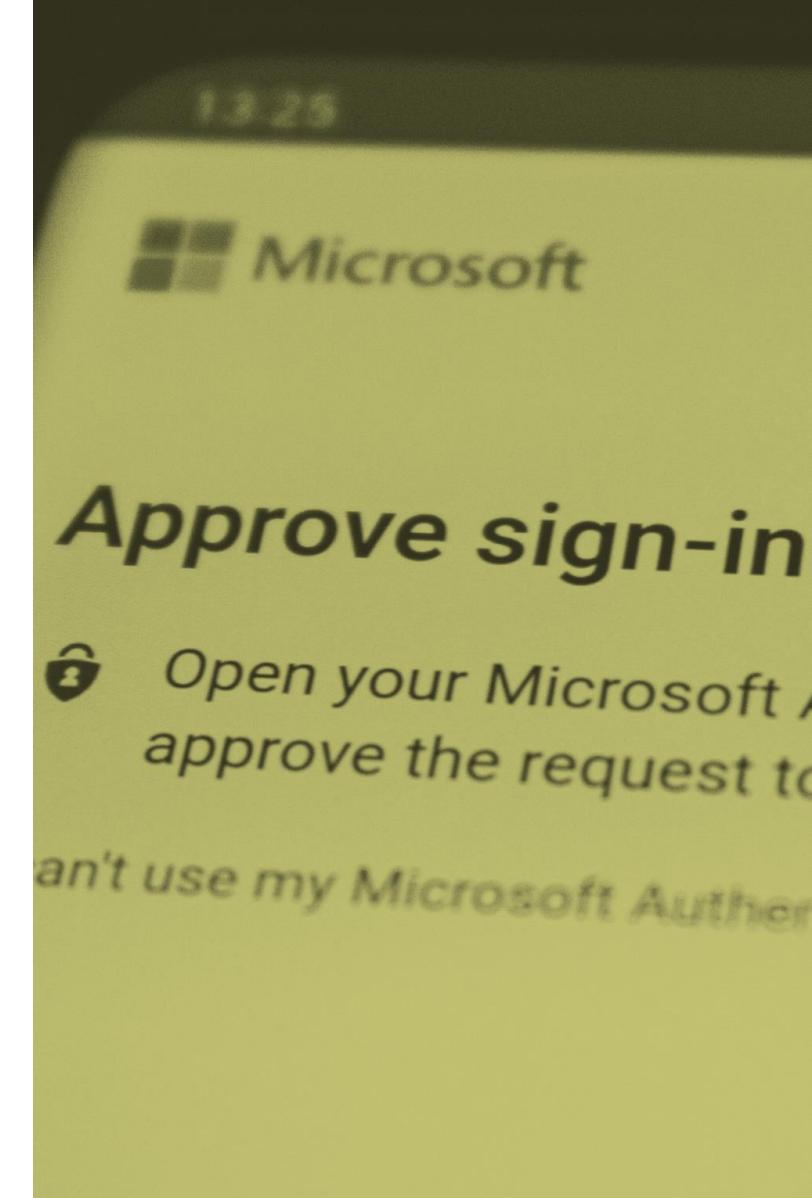

- Use “**Full disk encryption**” if you are using a personal computer or laptop. This is called FileVault on Mac OS and “**device encryption**” or Bitlocker on Windows.
- Encrypt individual files in Microsoft Office using the “Protect Document” function.
- Other files can be encrypted using Disk Utility on Mac OS or with a third-party tool like VeraCrypt.

For more details see our webpage: <https://rdm.mcmaster.ca/secure>

How should I protect my data?

Enable Multi-Factor Authentication (MFA)

- Also known as 2 Factor Authentication (2FA)
- Requires more than one code or ‘Factor’ to login – typically 2 factors: password and a security code sent to your phone number or generated by a linked authenticator app
- Most web services (Gmail, Dropbox, etc) provide MFA

Password Best Practices

Make sure your online information is secure by ensuring your password is:

- ✓ **Strong:** Make a strong password by combining a series of numbers, letters, and symbols into a long series of words. Try to combine them into something memorable – like L1br@ryt1pS.
- ✓ **Unique:** Use a different password for every website/service
- ✓ **Secret:** Never share your passwords with anybody, even if you trust them. Keep your passwords secret by storing them only in your head. Never send them in an email!
- ✓ **Devices:** Use a strong password on your computer and phone, too
- ✓ **Monitored:** Watch for data breaches in platforms you use and change your password when they happen.

Tip: Remembering multiple passwords can be difficult. Use a trusted password manager to keep track of your passwords for you. Some examples are BitWarden and 1Password.

Common Password Mistakes

Here are some common mistakes people make when creating passwords:

Service	Email	Password
MacID	example@mcmaster.ca	football
DropBox	example@mcmaster.ca	football
Google	test.example@gmail.com	football
Instagram	test.example@gmail.com	football1
ORCID	example@mcmaster.ca	football
Zotero	example@mcmaster.ca	football

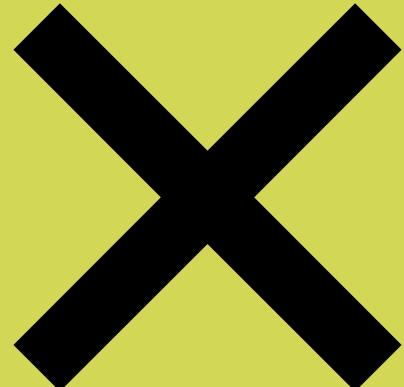

Written Down: Passwords written down on a piece of paper or stored in plain text on a computer may be stolen by somebody with malicious intent or easily lost.

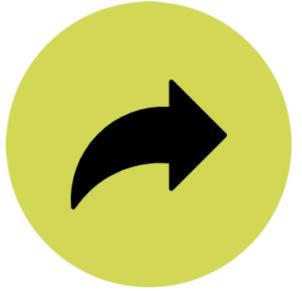

Too Simple: Simple or common passwords are easy to guess or brute force.
Examples: *apple, rowboat, bumblebee, blizzard, password*

Same Password: Using the same password for multiple websites is like having one key for multiple locks; if it's stolen, the thief can open them all.

Have you made any of these mistakes before?

What is the worst password you can imagine? (add plus signs to the ones you think are the worst! winner wins a tiny croc to put on your crocs!)

5. Make sure your data is ready for archival and sharing

- **Data Sharing:** Open and free data sharing supports research ideals like transparency, accessibility, reproducibility, collaboration, and maximizes the impact and visibility of research.
- **Data Archiving:** What do you plan to do with your data once it's been published? How will you ensure that your data remains accessible (to you and others) long-term?

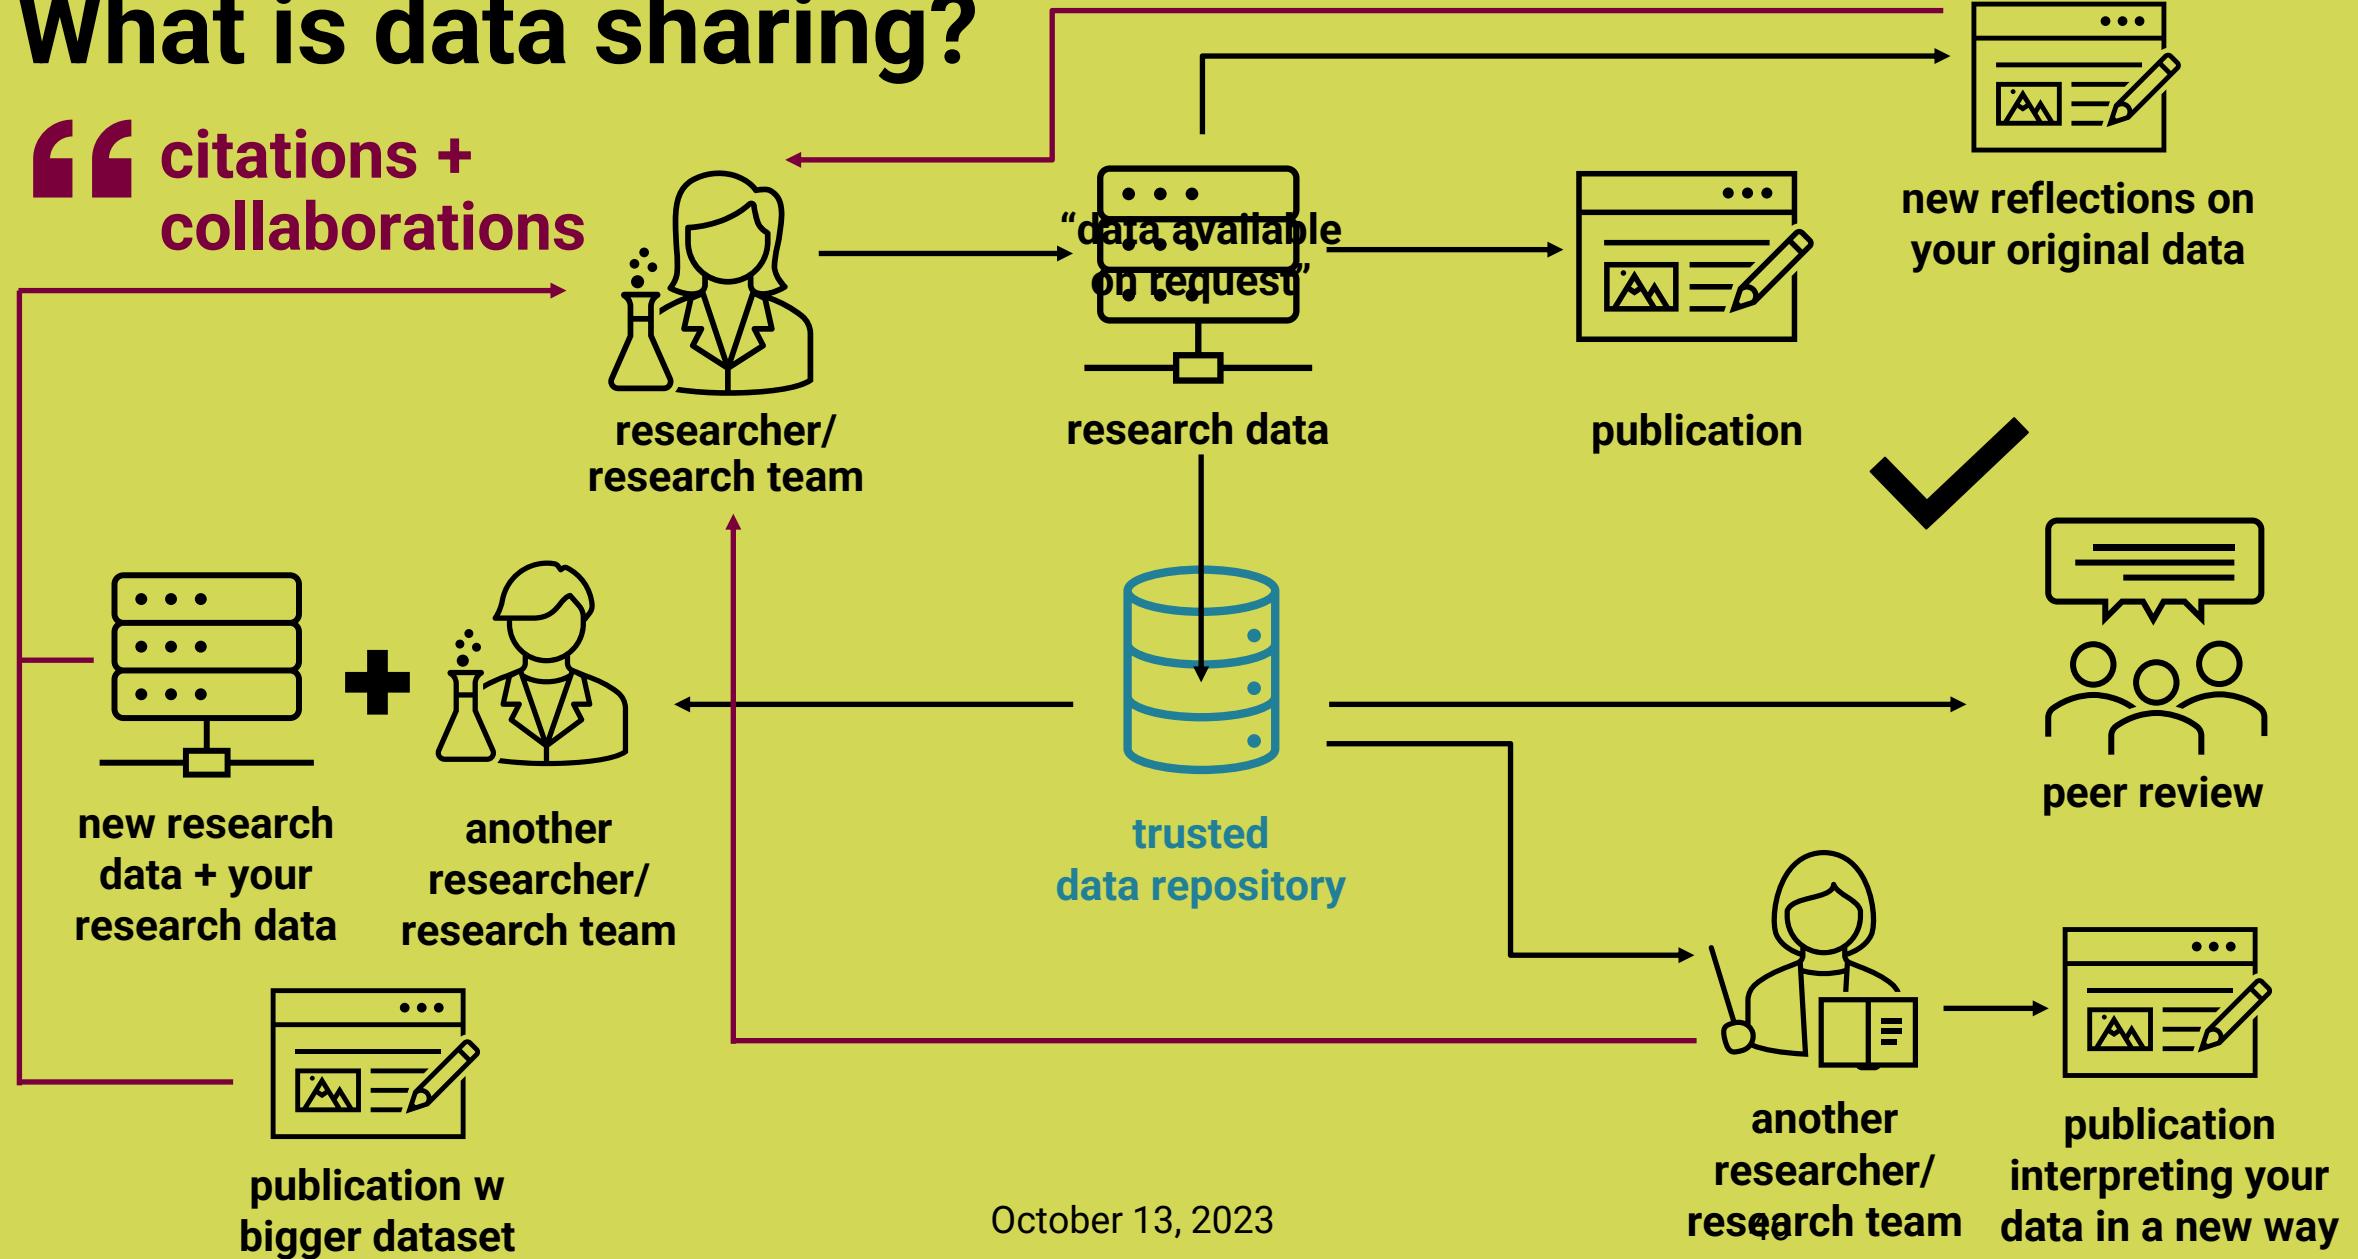

Open Research

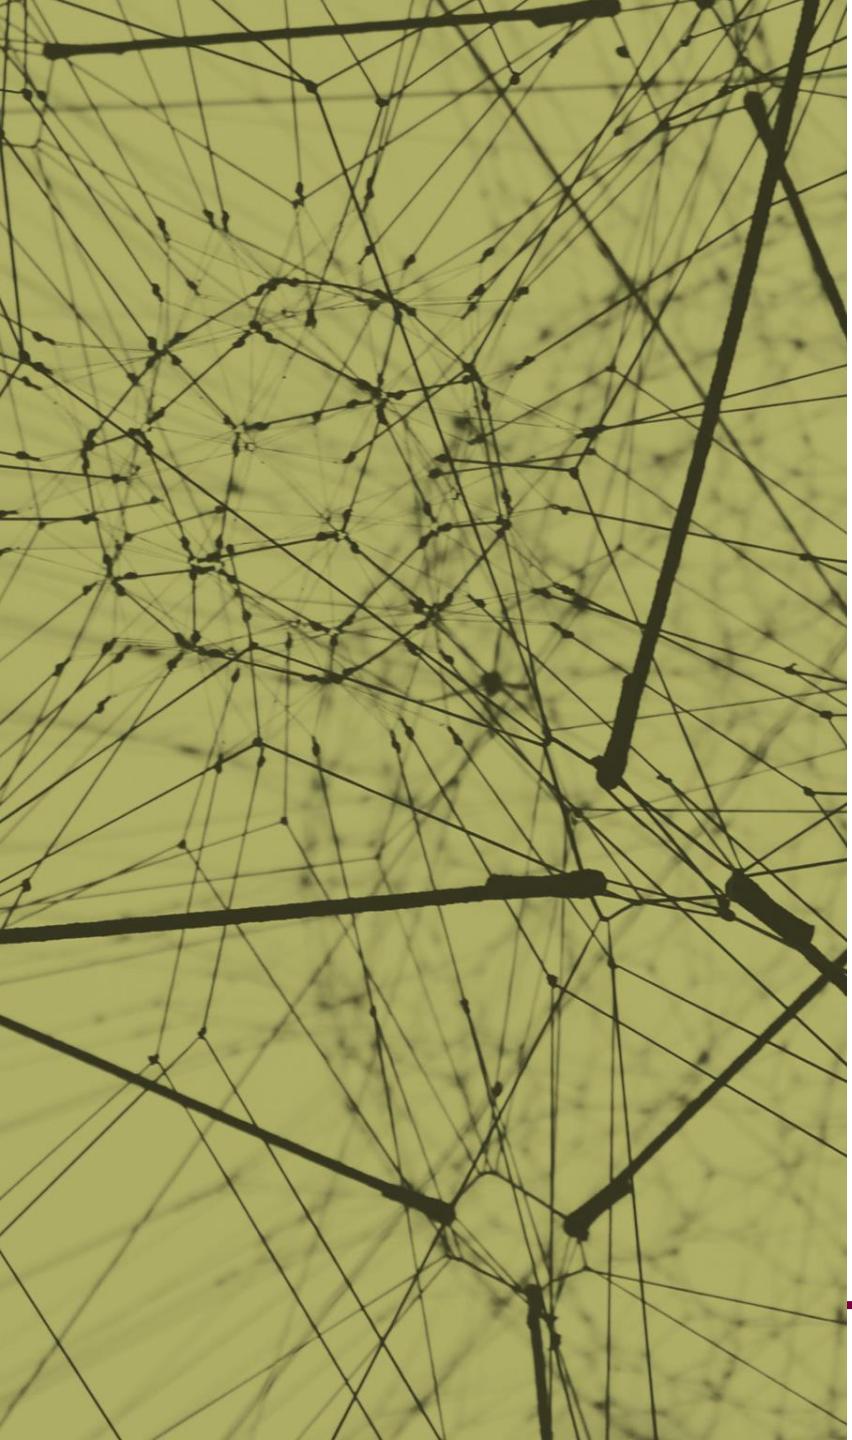

- Supports **reproducibility** and **replicability** – heightens confidence in results and supports research integrity
- Leads to **new collaborations** – potential for meta-analyses over a wider topic area.
- Research is often publicly funded – data as a “public good” that is accessible by journalists, other researchers, etc.
- Limits **over-researching communities** for qualitative studies. Share datasets with **community partners** – value added, support long-lasting research relationships.

What is data sharing?

“ citations + collaborations

Why share data? Citation Impact

Studies show that **publications with open data are cited more**.

- Publications in PLOS and BMC journals with open data have up to 25% higher citation impact compared to those that don't share data.
 - Collavazi et al, 2020 PLOSOne The citation advantage of linking publications to research data <https://doi.org/10.1371/journal.pone.0230416>
- Publications of gene expression microarray data have higher citation impact when the data is shared.
 - Piwowar & Vision, 2013 PeerJ Data reuse and the open data citation advantage <https://doi.org/10.7717/peerj.175>

Why share data? **Journal and Funder Requirements**

Many journals are starting to require data sharing or at least **data availability statements**, including:

- PLOS <https://journals.plos.org/plosone/s/data-availability>
- Nature <https://www.nature.com/nature-portfolio/editorial-policies/reporting-standards>
- NEJM <https://www.nejm.org/about-nejm/editorial-policies>

Journals with higher Impact Factors are more likely to have data sharing policies.

Why share data? Funder Requirements

The screenshot shows the CIHR website with the following navigation path: Home > Interagency research funding > Policies and Guidelines > Research Data Management. The main content is the "Tri-Agency Research Data Management Policy". A sidebar on the left includes links for the Tri-Agency Statement of Principles on Digital Data Management, Open Letter, and Frequently Asked Questions. The NIH Scientific Data Sharing page is also visible at the bottom.

Government of Canada Gouvernement du Canada

Home > Interagency research funding > Policies and Guidelines > Research Data Management

Research Data Management

Tri-Agency Research Data Management Policy

1. Preamble

The Canadian Institutes of Health Research (CIHR), the Natural Sciences and Engineering Research Council of Canada (NSERC), and the Social Sciences and Humanities Research Council of Canada (SSHRC) (the agencies) are federal granting agencies that promote support research, research training, knowledge transfer and innovation within Canada. The agencies expect the research they fund to be conducted to the highest professor and disciplinary standards, domestically and internationally. These standards support research excellence by ensuring that research is performed ethically and makes good of public funds, experiments and studies are replicable, and research results are as accessible as possible. Research data management (RDM) is a necessary part of research excellence.

ACCEESSING DATA

ABOUT

Data Management and Sharing Policy

NIH has a longstanding commitment to making the results of NIH-funded research available. Responsible data management and sharing has many benefits, including accelerating the pace of biomedical research, enabling validation of research results, and providing accessibility to high-value datasets.

About the Data Management and Sharing Policy →

Photo by Guillermo Ruiz on Unsplash.

Data Sharing – Archival and Preservation

Sharing data in a research data repository is a good way to ensure that data will be accessible over the long term.

- Datasets are given **DOIs**.
- Datasets are in platforms that have plans for long term storage.
- Datasets are published with enough documentation to enable re-use or re-analysis.

Data Repository Decision-Making

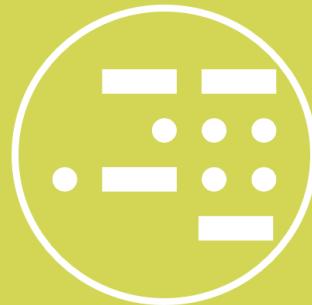

Publishing data in a recognized data repository is the best way to share data. There are thousands of data repositories.

Domain Specific Repositories
Focus on certain types of data such as genomic information or astronomical information.

General Repositories
Accept broader types of research data. ex. *McMaster Dataverse (part of Borealis)* and *Canada's Federated Research Data Repository (FRDR)*.

Code Repositories
There are also code-specific repositories like Github, Gitlab, BitBucket, SourceForge

Repository Finder
This tool by DataCite can help you find an appropriate repository to deposit your research data:
<https://repositoryfinder.datacite.org>

McMaster Dataverse

<https://borealisdata.ca/dataverse/mcmaster>

- McMaster's Institutional Data Repository is a home for all research data originating from McMaster researchers.
- Provides basic data curation services
- Data is stewarded by professionals at McMaster
- Choose whether to share data openly or through an application process

The screenshot shows the McMaster University Dataverse homepage. At the top, there is a navigation bar with links for 'Search', 'User Guide', 'Support', 'English', and 'Log In'. Below the navigation is the McMaster University logo. The main content area has a heading 'About Dataverse' followed by a paragraph of text. It includes a bulleted list of instructions for depositing data and a link to 'Research Data Management'. There is also a contact email address: rdm@mcmaster.ca. Below this is a search bar with 'Advanced Search' and a 'Sort' button. On the left, there is a sidebar with filters for 'Dataverses (19)', 'Datasets (64)', and 'Files (783)'. The main content area displays two dataset cards: 'Long-term Rocky Tidal Community Data from Discovery Bay, Jamaica' by Jurek, Kolasa, and 'Nurr1 is not an essential regulator of BDNF in mouse cortical neurons' by May 30, 2022.

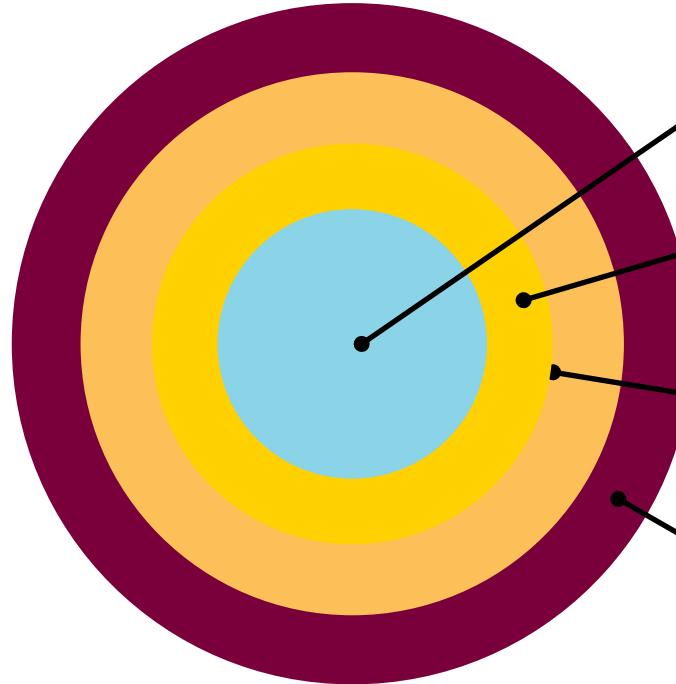

Federated Research Data Repository (FRDR)

<https://www.frdr-dfdr.ca/repo/>

- Available to any researcher affiliated with a Canadian institution
- Built for large (1 TB+) datasets
- Datasets are actively curated by professional staff at FRDR
- Datasets must be open access but can be embargoed for a one-year period

Datasets as a digital objects.

Research output (data/code): The data is surrounded by layers of information to make it FAIR

Identifiers: Persistent Unique Identifiers such as DOIs and ORCiDs help find, track, and cite data

Standards: Open standard file formats help others access and reuse data

Metadata: Rich metadata and data documentation helps others find and understand datasets

Persistent Identifiers help keep track of everything and make research findable.

Persistent Identifiers (PIPs) are unique links that will never expire.

- Digital Object Identifiers (DOIs): Can be minted for **publications, datasets, lab equipment, research software** and more.
- Open Researcher & Contributor ID (ORCID): Unique identifier for **researchers**. Distinguish yourself from scholars with the same name; connect your datasets, code, and publications.

Standards - File Formats

Have you ever saved data on a CD, DVD, or BluRay? How about a zip disk or HD DVD? Do you use Google Docs or Prezi where all your documents are stored online on a proprietary platform in a proprietary format? What would you do if that platform closed down?

Other researchers may not have access to any proprietary software you use, so data and metadata should ideally be stored in **sustainable formats**. Look for formats that are:

- Standardized
- Well documented
- In common usage
- Uncompressed

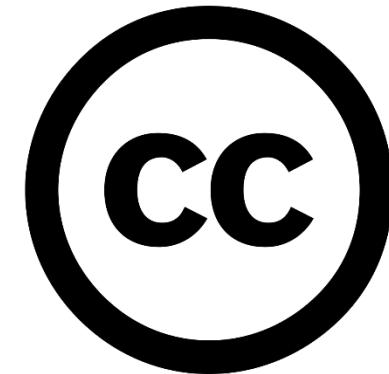

Research instrument files may be manufacturer specific and should be converted to a sustainable format when possible. See
[https://site.uit.no/dataverseno/deposit/prepare/
#what-are-preferred-file-formats](https://site.uit.no/dataverseno/deposit/prepare/#what-are-preferred-file-formats)

Metadata - Data Licensing

- **Creative Commons (CC)** - (creativecommons.org)
 - CC0 – public domain dedication
 - CC-BY – require attribution
 - There are further restrictions that can be added such as NC
- **Open Data Commons** (opendatacommons.org)
 - Similar licenses to CC but built for data
 - PDDL - Public Domain Dedication and License
 - ODC-By – require attribution
 - ODbL – attribution and share alike
- **Traditional Knowledge (TK)**: In addition to the First Nations Information Governance Centre's OCAP® training, communities may also use TK licenses - localcontexts.org/licenses

Images from Sq'ewlets, "Traditional Knowledge Labels," http://digitalsqewlets.ca/traditional-knowledge_connaissances_traditionnelles-eng.php and [Creative Commons](#), fixed by Quibik.

In our Stó:lō culture, certain types of knowledge are restricted in some way. This knowledge is considered sacred, secret, potent and/or private, and only certain people or families can and should have access to them. We call this xa:xa in our language. This label indicates that there is additional knowledge about a certain subject that cannot be shared on the website.

Metadata - Tags + Documentation

Metadata is “data about data” - keywords and tags to help with searching, or documents that explain your decision making and organization.

Metadata: When you deposit data in a repository, include metadata such as a title, date the data was collected, language, description, keywords, geographic location, and more. This helps other researchers narrow down the search and understand if the data is useful to them.

Documentation: Deposit a README file alongside your dataset to ensure others can understand how you gathered the data and how they can use it.

<https://rdm.mcmaster.ca/publish>

This checklist augments our more comprehensive [McMaster Dataverse Data Deposit Guidelines](#) and [McMaster Dataverse Deposit Walkthrough](#) documents. Items marked with an asterisk * are mandatory for submissions.

Before Deposit

- ***README:** Develop a README file to submit alongside dataset [template, [more info](#)]. You do not need to use the template but information equivalent to sections 1-3 from the template is required.
- Documentation:** Gather all the documentation for your dataset, potentially including: data dictionary, data model, code book, interview guide, etc. [[more info](#)]
- ***Anonymization/De-Identification:** McMaster Dataverse does NOT accept datasets containing confidential or sensitive information. Remove, replace, or redact data until they are de-identified and non-confidential. [[more info](#)]
- ***Ethics Approval:** Confirm you have MREB or HiREB approval to share data (*if applicable*).
- ***Citation and Credits:** Confirm you have credited, linked, and cited third-party sources, including data, code, or software (*if applicable*)
- Dataset organization:** Use consistent file naming and folder organization. A well-structured dataset is easier to understand and share. [[more info](#)]
- Sustainable file formats:** Make your data files accessible long-term and for re-use. [[more info](#)]

During Deposit

- ***Account + New Dataset:** [Access McMaster Dataverse](#) and set up your account by clicking “Log In” at the top of the page. Click “Add Data” and “New Dataset”.
- ***Data License:** Select an open license under “Dataset Template.” [[more info](#)]
- ***Add Metadata:** Ensure your data is findable by adding descriptive information.
 - ***Basic Metadata:** Add Title, Author, Contact, Description, and Subject. [[more info](#)]
 - ***Publication:** Enter citation information to Related Publication(s) – *min. title + journal*.
 - Time:** Add details to “Time Period Covered” and “Date of Collection” (*if applicable*)
 - Place:** Add details to “Geospatial Metadata” (*if applicable*)
- Researcher ID:** Connect your research by adding an ORCID or another researcher ID for yourself and your collaborators. [[more info](#)]
- ***Dataset:** Upload data files under the “Files” heading – click “+ Select Files to Add” – *.zip files are unpacked automatically. If you have a lot of files, compress the whole directory in a .zip and upload that file to maintain file/folder structure.*
- File Names + Tags:** Modify file names and add text descriptions. If desired, add tags for clarity –

Open Access (OA) Publishing

Tri-Agency funded research *must* be published open access. We encourage all research to be published open access when possible!

Publication Repositories

- Final manuscripts can be deposited in an institutional or disciplinary repository (such as [arXiv.org](https://arxiv.org))
- Researcher is responsible to navigate copyright requirements of the journal, but there are lots of resources available. Learn more about Open Access here:
<https://library.mcmaster.ca/research/open-access#tab-open-access-publishing>

Journals

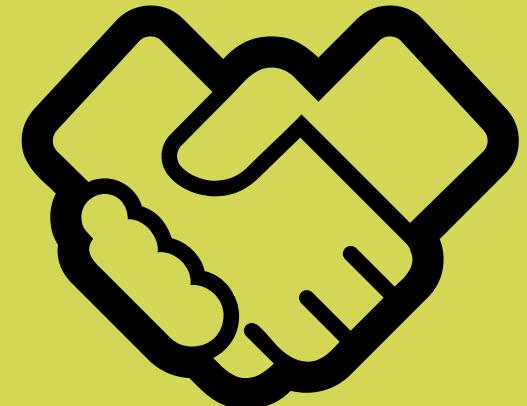

- Journal provides open access to the article (within 12 months)
- Most journals will charge open access fees

MacSphere

- McMaster's institutional publication repository. This is where graduates publish theses!
- Publish your data in McMaster Dataverse, publication in MacSphere, link both. We can help!

What are some opportunities you can think about with sharing data? What are some hesitations you might have?

Top 4 ideas for improving your research data management:

Make a **plan** for data management.

Create a **file organization scheme** (and use it).

Ensure your data is safely **stored** and backed up.

Share your data openly.

RDM Community of Practice

- Teams channel hosting asynchronous discussion
- Monthly meetings featuring presentations from researchers across the university on how they do data management
- **Thursday, September 28 – 11 AM -12 PM.**
DMP Roundtable: Natalie Harvey-Younis (Psychiatry & Behavioural Neurosciences); Benjamin Taylor (MacPherson Institute); Melissa Parker and Saleha Ansari (Rehabilitation Science)

All are welcome to join! <https://u.mcmaster.ca/rdm-community>
